# Foundations of Software Fall 2023

# Week 5

1

### Plan

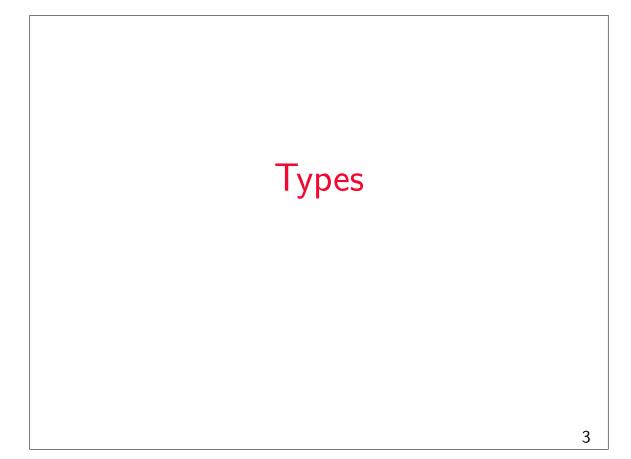

PREVIOUSLY: untyped lambda calculus

TODAY: types!!

- 1. Two example languages:
  - 1.1 typing arithmetic expressions
  - 1.2 simply typed lambda calculus (STLC)
- 2. For each:
  - 2.1 Define types
  - 2.2 Specify typing rules
  - 2.3 Prove soundness: progress and preservation

NEXT: lambda calculus extensions

NEXT: polymorphic typing

# Questions

What are your questions?

# Problematic arithmetic expressions

Consider the term

```
t = if true then (pred false) else 0
```

Clicker question: What can we say about it? (multiple possible answers)

- A. t is stuck
- B. t is a closed term
- C. t is typeable, i.e., there exists T such that t: T
- D. there exists t' such that  $t \longrightarrow^* t'$  and t' is stuck

URL: ttpoll.eu Session ID: cs452

5

# Safety for arithmetic expressions

Recall from last week: safety = progress + preservation, given some definition of "t is valid".

- ▶ Progress: if t is valid, then either t is a value, or  $t \longrightarrow t'$ .
- ▶ Preservation: if t is valid and t  $\longrightarrow$  t', then t' is valid.

What is "is valid" for arithmetic expressions?

# The type of variables in STLC

Consider the term

```
t = \lambda x : Bool. if x then false else true
```

Clicker question: What is T in x : T?

```
A. T = Bool
```

- B.  $T = Bool \rightarrow Bool$
- C. there are multiple such T's
- D. none of the above

URL: ttpoll.eu Session ID: cs452

7

# Safety for STLC

What is "is valid" for the Simply Typed Lambda Calculus with Booleans?

### Outline

- 1. begin with a set of terms, a set of values, and an evaluation relation
- 2. define a set of *types* classifying values according to their "shapes"
- 3. define a *typing relation* t : T that classifies terms according to the shape of the values that result from evaluating them
- 4. check that the typing relation is sound in the sense that,

```
4.1 if t : T and t \longrightarrow^* v, then v : T
4.2 if t : T, then evaluation of t will not get stuck
```

9

# Recall: Arithmetic Expressions – Syntax

```
t ::=
                                               terms
        true
                                                 constant true
                                                constant false
        false
        if t then t else t
                                                conditional
                                                constant zero
        succ t
                                                successor
                                                predecessor
        pred t
                                                zero test
        iszero t
                                               values
v ::=
                                                true value
        true
        false
                                                false value
                                                numeric value
        nv
                                               numeric values
nv ::=
                                                zero value
        0
                                                successor value
        succ nv
```

# Recall: Arithmetic Expressions - Evaluation Rules

if true then 
$$t_2$$
 else  $t_3 \longrightarrow t_2$  (E-IFTRUE)

if false then 
$$t_2$$
 else  $t_3 \longrightarrow t_3$  (E-IFFALSE)

pred (succ 
$$nv_1$$
)  $\longrightarrow nv_1$  (E-PREDSUCC)

iszero 
$$0 \longrightarrow \text{true}$$
 (E-ISZEROZERO)

$$\texttt{iszero} \ (\texttt{succ} \ \texttt{nv}_1) \longrightarrow \texttt{false} \ \ \big( E\text{-}IszeroSucc} \big)$$

11

# Recall: Arithmetic Expressions - Evaluation Rules

$$\frac{\texttt{t}_1 \longrightarrow \texttt{t}_1'}{\texttt{if } \texttt{t}_1 \texttt{ then } \texttt{t}_2 \texttt{ else } \texttt{t}_3 \longrightarrow \texttt{if } \texttt{t}_1' \texttt{ then } \texttt{t}_2 \texttt{ else } \texttt{t}_3} \texttt{ (E-IF)}$$

$$\frac{\mathtt{t}_1 \longrightarrow \mathtt{t}_1'}{\mathtt{succ} \ \mathtt{t}_1 \longrightarrow \mathtt{succ} \ \mathtt{t}_1'} \tag{E-Succ}$$

$$rac{\mathtt{t}_1 \longrightarrow \mathtt{t}_1'}{\mathtt{pred} \ \mathtt{t}_1 \longrightarrow \mathtt{pred} \ \mathtt{t}_1'}$$
 (E-PRED)

$$\frac{\mathtt{t}_1 \longrightarrow \mathtt{t}_1'}{\mathtt{iszero} \ \mathtt{t}_1 \longrightarrow \mathtt{iszero} \ \mathtt{t}_1'} \qquad \qquad \text{(E-IsZero)}$$

# **Types**

In this language, values have two possible "shapes": they are either booleans or numbers.

$$\begin{array}{ccc} T & ::= & & \textit{types} \\ & & \textit{Bool} & & \textit{type of booleans} \\ & & \textit{Nat} & & \textit{type of numbers} \end{array}$$

13

```
Typing Rules
                                                      (T-True)
                            true : Bool
                                                     (T-FALSE)
                           false : Bool
                   t_1: Bool t_2: T t_3: T
                                                         (T-IF)
                    if t_1 then t_2 else t_3:T
                              0 : Nat
                                                      (T-Zero)
                             t_1: Nat
                                                      (T-Succ)
                           succ t_1 : Nat
                             t_1: Nat
                                                      (T-Pred)
                           pred t_1 : Nat
                             t<sub>1</sub>: Nat
                                                    (T-IsZero)
                         iszero t_1: Bool
```

14

# **Typing Derivations**

Every pair (t,T) in the typing relation can be justified by a derivation tree built from instances of the inference rules.

Proofs of properties about the typing relation often proceed by induction on typing derivations.

15

# Imprecision of Typing

Like other static program analyses, type systems are generally *imprecise*: they do not predict exactly what kind of value will be returned by every program, but just a conservative (safe) approximation.

$$\frac{\mathsf{t}_1 : \mathsf{Bool} \qquad \mathsf{t}_2 : \mathsf{T} \qquad \mathsf{t}_3 : \mathsf{T}}{\mathsf{if} \ \mathsf{t}_1 \ \mathsf{then} \ \mathsf{t}_2 \ \mathsf{else} \ \mathsf{t}_3 : \mathsf{T}} \tag{T-IF}$$

Using this rule, we cannot assign a type to

```
if true then 0 else false
```

even though this term will certainly evaluate to a number.

# Type Safety

The safety (or soundness) of this type system can be expressed by two properties:

- 1. Progress: A well-typed term is not stuck If t:T, then either t is a value or else  $t\longrightarrow t'$  for some t'.
- 2. Preservation: Types are preserved by one-step evaluation If t:T and  $t\longrightarrow t'$ , then t':T.

17

### Inversion

- 1. If true : R, then R = Bool.
- 2. If false: R, then R = Bool.
- 3. If if  $t_1$  then  $t_2$  else  $t_3$ : R, then  $t_1$ : Bool,  $t_2$ : R, and  $t_3$ : R.
- 4. If 0 : R, then R = Nat.
- 5. If succ  $t_1$ : R, then R = Nat and  $t_1$ : Nat.
- 6. If pred  $t_1$ : R, then R = Nat and  $t_1$ : Nat.
- 7. If iszero  $t_1 : R$ , then R = Bool and  $t_1 : Nat$ .

```
Lemma:
```

```
    If true: R, then R = Bool.
    If false: R, then R = Bool.
    If if t<sub>1</sub> then t<sub>2</sub> else t<sub>3</sub>: R, then t<sub>1</sub>: Bool, t<sub>2</sub>: R, and t<sub>3</sub>: R.
    If 0: R, then R = Nat.
    If succ t<sub>1</sub>: R, then R = Nat and t<sub>1</sub>: Nat.
    If pred t<sub>1</sub>: R, then R = Nat and t<sub>1</sub>: Nat.
    If iszero t<sub>1</sub>: R, then R = Bool and t<sub>1</sub>: Nat.
    Proof: ...
```

18

### Inversion

### Lemma:

```
    If true: R, then R = Bool.
    If false: R, then R = Bool.
    If if t<sub>1</sub> then t<sub>2</sub> else t<sub>3</sub>: R, then t<sub>1</sub>: Bool, t<sub>2</sub>: R, and t<sub>3</sub>: R.
    If 0: R, then R = Nat.
    If succ t<sub>1</sub>: R, then R = Nat and t<sub>1</sub>: Nat.
    If pred t<sub>1</sub>: R, then R = Nat and t<sub>1</sub>: Nat.
    If iszero t<sub>1</sub>: R, then R = Bool and t<sub>1</sub>: Nat.

Proof: ...
```

This leads directly to a recursive algorithm for calculating the type of a term...

# Typechecking Algorithm

```
typeof(t) = if t = true then Bool
            else if t = false then Bool
            else if t = if t1 then t2 else t3 then
              let T1 = typeof(t1) in
              let T2 = typeof(t2) in
              let T3 = typeof(t3) in
              if T1 = Bool and T2=T3 then T2
              else "not typable"
            else if t = 0 then Nat
            else if t = succ t1 then
              let T1 = typeof(t1) in
              if T1 = Nat then Nat else "not typable"
            else if t = pred t1 then
              let T1 = typeof(t1) in
              if T1 = Nat then Nat else "not typable"
            else if t = iszero t1 then
              let T1 = typeof(t1) in
              if T1 = Nat then Bool else "not typable"
```

19

# Properties of the Typing Relation

# Recall: Typing Rules

```
(T-True)
         true : Bool
        false : Bool
                                     (T-False)
t_1 : Bool \qquad t_2 : T
                       t_3:T
                                         (T-IF)
if t_1 then t_2 else t_3: T
           0 : Nat
                                      (T-Zero)
           t_1: Nat
                                      (T-Succ)
        succ t_1 : Nat
           t_1: Nat
                                      (T-Pred)
        pred t<sub>1</sub>: Nat
          t<sub>1</sub>: Nat
                                    (T-IsZero)
      iszero t_1: Bool
```

21

### Recall: Inversion

### Lemma:

- 2. If false: R, then R = Bool.
- 3. If if  $t_1$  then  $t_2$  else  $t_3$ : R, then  $t_1$ : Bool,  $t_2$ : R, and  $t_3$ : R.
- 4. If 0 : R, then R = Nat.

1. If true : R, then R = Bool.

- 5. If succ  $t_1$ : R, then R = Nat and  $t_1$ : Nat.
- 6. If pred  $t_1$ : R, then R = Nat and  $t_1$ : Nat.
- 7. If iszero  $t_1 : R$ , then R = Bool and  $t_1 : Nat$ .

### Lemma:

- 1. If v is a value of type Bool, then v is either true or false.
- 2. If v is a value of type Nat, then v is a numeric value.

### Proof:

23

### **Canonical Forms**

### Lemma:

- 1. If v is a value of type Bool, then v is either true or false.
- 2. If v is a value of type Nat, then v is a numeric value.

### *Proof:* Recall the syntax of values:

### Lemma:

- 1. If v is a value of type Bool, then v is either true or false.
- 2. If v is a value of type Nat, then v is a numeric value.

### *Proof:* Recall the syntax of values:

For part 1, if v is true or false, the result is immediate.

23

### Canonical Forms

### Lemma:

- 1. If v is a value of type Bool, then v is either true or false.
- 2. If v is a value of type Nat, then v is a numeric value.

### Proof: Recall the syntax of values:

For part 1, if v is true or false, the result is immediate. But v cannot be 0 or succ nv, since the inversion lemma tells us that v would then have type Nat, not Bool.

### Lemma:

- 1. If v is a value of type Bool, then v is either true or false.
- 2. If v is a value of type Nat, then v is a numeric value.

### *Proof:* Recall the syntax of values:

For part 1, if v is true or false, the result is immediate. But v cannot be 0 or succ nv, since the inversion lemma tells us that v would then have type Nat, not Bool. Part 2 is similar.

23

# **Progress**

Theorem: Suppose t is a well-typed term (that is, t: T for some type T). Then either t is a value or else there is some t' with  $t \longrightarrow t'$ .

Theorem: Suppose t is a well-typed term (that is, t: T for some type T). Then either t is a value or else there is some t' with  $t \longrightarrow t'$ .

Proof:

24

# **Progress**

Theorem: Suppose t is a well-typed term (that is, t: T for some type T). Then either t is a value or else there is some t' with  $t \longrightarrow t'$ .

*Proof:* By induction on a derivation of t:T.

Theorem: Suppose t is a well-typed term (that is, t: T for some type T). Then either t is a value or else there is some t' with  $t \longrightarrow t'$ .

*Proof:* By induction on a derivation of t: T.

The T-TRUE, T-FALSE, and T-ZERO cases are immediate, since t in these cases is a value.

24

# **Progress**

Theorem: Suppose t is a well-typed term (that is, t: T for some type T). Then either t is a value or else there is some t' with  $t \longrightarrow t'$ .

*Proof:* By induction on a derivation of t: T.

The T-TRUE, T-FALSE, and T-ZERO cases are immediate, since t in these cases is a value.

```
Case T-IF: t = \text{if } t_1 \text{ then } t_2 \text{ else } t_3
t_1 : \text{Bool} \qquad t_2 : T \qquad t_3 : T
```

Theorem: Suppose t is a well-typed term (that is, t: T for some type T). Then either t is a value or else there is some t' with  $t \longrightarrow t'$ .

*Proof:* By induction on a derivation of t: T.

The T-TRUE, T-FALSE, and T-ZERO cases are immediate, since t in these cases is a value.

```
Case T-IF: t = if t_1 then t_2 else t_3
t_1 : Bool t_2 : T t_3 : T
```

By the induction hypothesis, either  $t_1$  is a value or else there is some  $t_1'$  such that  $t_1 \longrightarrow t_1'$ . If  $t_1$  is a value, then the canonical forms lemma tells us that it must be either true or false, in which case either E-IFTRUE or E-IFFALSE applies to t. On the other hand, if  $t_1 \longrightarrow t_1'$ , then, by E-IF,

```
t \longrightarrow if t'_1 then t_2 else t_3.
```

24

# **Progress**

Theorem: Suppose t is a well-typed term (that is, t: T for some type T). Then either t is a value or else there is some t' with  $t \longrightarrow t'$ .

*Proof:* By induction on a derivation of t: T.

The cases for rules T-ZERO, T-SUCC, T-PRED, and T-ISZERO are similar.

(Recommended: Try to reconstruct them.)

# Preservation

Theorem: If t:T and  $t\longrightarrow t'$ , then t':T.

26

# Preservation

Theorem: If t:T and  $t\longrightarrow t'$ , then t':T.

*Proof:* By induction on the given typing derivation.

# Preservation

```
Theorem: If t : T and t \longrightarrow t', then t' : T.
```

*Proof:* By induction on the given typing derivation.

```
Case T-True: t = true T = Bool
```

Then t is a value.

26

### Preservation

```
Theorem: If t : T and t \longrightarrow t', then t' : T.
```

*Proof:* By induction on the given typing derivation.

```
Case T-IF:
```

```
\mathsf{t} = \mathsf{if} \ \mathsf{t}_1 \ \mathsf{then} \ \mathsf{t}_2 \ \mathsf{else} \ \mathsf{t}_3 \ \mathsf{t}_1 : \mathsf{Bool} \ \mathsf{t}_2 : \mathsf{T} \ \mathsf{t}_3 : \mathsf{T}
```

There are three evaluation rules by which  $t \longrightarrow t'$  can be derived: E-IFTRUE, E-IFFALSE, and E-IF. Consider each case separately.

### Preservation

```
Theorem: If t : T and t \longrightarrow t', then t' : T.
```

*Proof:* By induction on the given typing derivation.

```
Case T-IF:
```

```
t = if t_1 then t_2 else t_3 t_1 : Bool t_2 : T t_3 : T
```

There are three evaluation rules by which  $t \longrightarrow t'$  can be derived: E-IFTRUE, E-IFFALSE, and E-IF. Consider each case separately.

```
Subcase E-IFTRUE: t_1 = true t' = t_2
Immediate, by the assumption t_2: T.
```

```
(E-IFFALSE subcase: Similar.)
```

26

### Preservation

```
Theorem: If t : T and t \longrightarrow t', then t' : T.
```

*Proof:* By induction on the given typing derivation.

```
Case T-IF:
```

```
t = if t_1 then t_2 else t_3 t_1 : Bool t_2 : T t_3 : T
```

There are three evaluation rules by which  $t \longrightarrow t'$  can be derived: E-IFTRUE, E-IFFALSE, and E-IF. Consider each case separately.

```
\textit{Subcase} \ E\text{-IF:} \qquad \texttt{t}_1 \longrightarrow \texttt{t}_1' \qquad \texttt{t}' = \texttt{if} \ \texttt{t}_1' \ \texttt{then} \ \texttt{t}_2 \ \texttt{else} \ \texttt{t}_3
```

Applying the IH to the subderivation of  $t_1$ : Bool yields

 $t_1'$ : Bool. Combining this with the assumptions that  $t_2$ : T and

 $\ensuremath{\text{t}_3}$  :  $T_{\ensuremath{\text{r}}}$  we can apply rule  $\operatorname{T-IF}$  to conclude that

if  $t'_1$  then  $t_2$  else  $t_3$ : T, that is, t': T.

# Messing With It

27

# Messing with it: Remove a rule

What if we remove E-PREDZERO ?

# Messing with it: Remove a rule

What if we remove E-PREDZERO?

Then pred 0 type checks, but it is stuck and is not a value. Thus the progress theorem fails.

28

# Messing with it: If

What if we change the rule for typing if's to the following?:

$$\frac{\texttt{t}_1 : \texttt{Bool} \qquad \texttt{t}_2 : \texttt{Nat} \qquad \texttt{t}_3 : \texttt{Nat}}{\texttt{if} \ \texttt{t}_1 \ \texttt{then} \ \texttt{t}_2 \ \texttt{else} \ \texttt{t}_3 : \texttt{Nat}} \tag{T-IF}$$

# Messing with it: If

What if we change the rule for typing if's to the following?:

$$\frac{\texttt{t}_1 : \texttt{Bool} \qquad \texttt{t}_2 : \texttt{Nat} \qquad \texttt{t}_3 : \texttt{Nat}}{\texttt{if} \ \texttt{t}_1 \ \texttt{then} \ \texttt{t}_2 \ \texttt{else} \ \texttt{t}_3 : \texttt{Nat}} \tag{T-IF}$$

The system is still sound. Some if's do not type, but those that do are fine.

29

# Messing with it: adding bit

 $t ::= terms \ ... \ bit(t) boolean to natural$ 

- 1. evaluation rule
- 2. typing rule
- 3. progress and preservation updates

# The Simply Typed Lambda-Calculus

31

# The simply typed lambda-calculus

The system we are about to define is commonly called the *simply* typed lambda-calculus, or  $\lambda \rightarrow$  for short.

Unlike the untyped lambda-calculus, the "pure" form of  $\lambda_{\rightarrow}$  (with no primitive values or operations) is not very interesting; to talk about  $\lambda_{\rightarrow}$ , we always begin with some set of "base types."

- So, strictly speaking, there are *many* variants of  $\lambda_{\rightarrow}$ , depending on the choice of base types.
- ► For now, we'll work with a variant constructed over the booleans.

# Untyped lambda-calculus with booleans

```
t ::=
                                                terms
                                                  variable
         X
        \lambda x.t
                                                 abstraction
        t t
                                                 application
        true
                                                 constant true
                                                 constant false
        false
        if t then t else t
                                                 conditional
v ::=
                                                values
                                                  abstraction value
        \lambda \mathtt{x.t}
                                                 true value
        true
        false
                                                 false value
```

# "Simple Types"

```
 \begin{array}{ccc} T & ::= & & \textit{types} \\ & & \text{Bool} & & \textit{type of booleans} \\ & & & \text{types of functions} \end{array}
```

What are some examples?

# Type Annotations

We now have a choice to make. Do we...

annotate lambda-abstractions with the expected type of the argument

$$\lambda x:T_1.$$
 t<sub>2</sub>

(as in most mainstream programming languages), or

continue to write lambda-abstractions as before

$$\lambda x. t_2$$

and ask the typing rules to "guess" an appropriate annotation (as in OCaml)?

Both are reasonable choices, but the first makes the job of defining the typing rules simpler. Let's take this choice for now.

true : Bool

if  $t_1$  then  $t_2$  else  $t_3:T$ 

35

(T-True)

# Typing rules

# Typing rules

$$\frac{???}{\lambda x: T_1. t_2: T_1 \rightarrow T_2}$$
 (T-Abs)

36

# Typing rules

$$\frac{\Gamma, x: T_1 \vdash t_2 : T_2}{\Gamma \vdash \lambda x: T_1 \cdot t_2 : T_1 \to T_2}$$
 (T-Abs)

$$\frac{x:T\in\Gamma}{\Gamma\vdash x:T} \tag{T-VAR}$$

36

# Typing rules

$$\Gamma \vdash \text{true} : \text{Bool}$$
 (T-TRUE)

$$\Gamma \vdash false : Bool$$
 (T-FALSE)

$$\frac{\Gamma \vdash t_1 : \texttt{Bool} \quad \Gamma \vdash t_2 : T \quad \Gamma \vdash t_3 : T}{\Gamma \vdash \texttt{if} \ t_1 \ \texttt{then} \ t_2 \ \texttt{else} \ t_3 : T} \quad \textbf{(T-IF)}$$

$$\frac{\Gamma, x: T_1 \vdash t_2 : T_2}{\Gamma \vdash \lambda x: T_1 \cdot t_2 : T_1 \to T_2}$$
 (T-Abs)

$$\frac{x:T\in\Gamma}{\Gamma\vdash x:T} \tag{T-VAR}$$

$$\frac{\Gamma \vdash t_1 : T_{11} \rightarrow T_{12} \qquad \Gamma \vdash t_2 : T_{11}}{\Gamma \vdash t_1 \ t_2 : T_{12}} \qquad \text{(T-APP)}$$

36

# **Typing Derivations**

What derivations justify the following typing statements?

- $\blacktriangleright$   $\vdash$  ( $\lambda$ x:Bool.x) true : Bool
- ► f:Bool→Bool ⊢

f (if false then true else false) : Bool

► f:Bool→Bool ⊢

 $\lambda x$ :Bool. f (if x then false else x):Bool $\rightarrow$ Bool

# Properties of $\lambda_{\rightarrow}$

The fundamental property of the type system we have just defined is *soundness* with respect to the operational semantics.

- 1. Progress: A closed, well-typed term is not stuck If  $\vdash t : T$ , then either t is a value or else  $t \longrightarrow t'$  for some t'.
- 2. Preservation: Types are preserved by one-step evaluation If  $\Gamma \vdash t : T$  and  $t \longrightarrow t'$ , then  $\Gamma \vdash t' : T$ .

# **Progress**

Theorem: Suppose t is a closed, well-typed term (that is,  $\vdash$  t : T for some T). Then either t is a value or else there is some t' with t  $\longrightarrow$  t'.

Proof: By induction

Theorem: Suppose t is a closed, well-typed term (that is,  $\vdash$  t : T for some T). Then either t is a value or else there is some t' with t  $\longrightarrow$  t'.

Proof: By induction on typing derivations.

42

# **Progress**

Theorem: Suppose t is a closed, well-typed term (that is,  $\vdash$  t : T for some T). Then either t is a value or else there is some t' with t  $\longrightarrow$  t'.

*Proof:* By induction on typing derivations. The cases for boolean constants and conditions are the same as before. The variable case is trivial (because t is closed). The abstraction case is immediate, since abstractions are values.

Theorem: Suppose t is a closed, well-typed term (that is,  $\vdash t : T$  for some T). Then either t is a value or else there is some t' with  $t \longrightarrow t'$ .

*Proof:* By induction on typing derivations. The cases for boolean constants and conditions are the same as before. The variable case is trivial (because t is closed). The abstraction case is immediate, since abstractions are values.

Consider the case for application, where  $t=t_1$   $t_2$  with  $\vdash t_1: T_{11} \rightarrow T_{12}$  and  $\vdash t_2: T_{11}$ .

# **Progress**

Theorem: Suppose t is a closed, well-typed term (that is,  $\vdash$  t : T for some T). Then either t is a value or else there is some t' with t  $\longrightarrow$  t'.

*Proof:* By induction on typing derivations. The cases for boolean constants and conditions are the same as before. The variable case is trivial (because t is closed). The abstraction case is immediate, since abstractions are values.

Consider the case for application, where  $\mathbf{t} = \mathbf{t}_1 \ \mathbf{t}_2$  with  $\vdash \mathbf{t}_1 : T_{11} \rightarrow T_{12}$  and  $\vdash \mathbf{t}_2 : T_{11}$ . By the induction hypothesis, either  $\mathbf{t}_1$  is a value or else it can make a step of evaluation, and likewise  $\mathbf{t}_2$ .

Theorem: Suppose t is a closed, well-typed term (that is,  $\vdash t : T$  for some T). Then either t is a value or else there is some t' with  $t \longrightarrow t'$ .

*Proof:* By induction on typing derivations. The cases for boolean constants and conditions are the same as before. The variable case is trivial (because t is closed). The abstraction case is immediate, since abstractions are values.

Consider the case for application, where  $\mathbf{t} = \mathbf{t}_1 \ \mathbf{t}_2$  with  $\vdash \mathbf{t}_1 : T_{11} \rightarrow T_{12}$  and  $\vdash \mathbf{t}_2 : T_{11}$ . By the induction hypothesis, either  $\mathbf{t}_1$  is a value or else it can make a step of evaluation, and likewise  $\mathbf{t}_2$ . If  $\mathbf{t}_1$  can take a step, then rule E-APP1 applies to  $\mathbf{t}$ . If  $\mathbf{t}_1$  is a value and  $\mathbf{t}_2$  can take a step, then rule E-APP2 applies. Finally, if both  $\mathbf{t}_1$  and  $\mathbf{t}_2$  are values, then the canonical forms lemma tells us that  $\mathbf{t}_1$  has the form  $\lambda \mathbf{x} : T_{11} \cdot \mathbf{t}_{12}$ , and so rule E-APPABS applies to  $\mathbf{t}$ .
